(54) CONTROL DEVICE FOR AIR CONDITIONER

(57)Abstract:

PROBLEM TO BE SOLVED: To provide a desirable automatic set temperature for user with a small memory capacity by providing a renewal memory control means for renewing the memory of a room-inside memory means on the basis of the relation between a computed room-inside temperature and a detected outside temperature.

SOLUTION: Outside air temperature from an outside air temperature sensor 3 is input to a CPU 14, and this outside air temperature is collated with an automatic set temperature table. A corresponding temperature is taken out from the room-inside set temperature table on the basis of the outside air temperature detected by the outside air temperature sensor 3, and this temperature is added to the reference temperature 25 C so as to set the automatic set temperature. As long as a user does not change this automatic set temperature to a user set temperature, this automatic set temperature is set as a room-inside set temperature. On the other hand, in the case where a user changes the automatic set temperature, the CPU 14 changes open degree of a mix door actuator, and controls an air conditioning carry-out unit so that the blow-out temperature is set at the user set temperature, and while starts the processing for renewing a memory of the automatic set temperature table.
